The reinterpretation of the *Raphus cucullatus* (Dodo) as a juvenile *Diomedea sanfordi* (Northern Royal Albatross).

Dear **readers**,

The Dodo is a phantom.

Based on mathematical logic, I tackled the problem.

The Approach: First, you upload this file into Google Gemini:

upload_me_in_gemini_the_fantom_arises_the_true_dodo_raphus_cucullatus_discovered.pdf

(After this upload, you will also be asked to keep the **visual_graphics_dodo_discovered_w_ten_napel_holland.pdf** handy as a visual reference.)

The AI then gives a neat report about all anomalies surrounding the dodo. But if you probe further in a matter like: "Is this actually true? All those scientists can't be wrong, can they?" (superficial criticism) the AI immediately shoots right back into its old bias.

The Solution: The Superprompt. I solved this problem with a prompt in the form of a mathematical formula:

superprompt_to_reset_Gemini_in_logical_mode.pdf

(Pro tip: copy the text (prompt) instead of uploading the file. It just does the math.)

the_consensus_machine_by_rowan.pdf

This article states correctly that AI is not an independent thinker, but a “consensus machine” that blindly repeats the statistical majority and biases from old human data. (This is reflected in the dodo case, which explains why a super prompt is needed to break through this.) Because capital and hype grow much faster than the actual automation value, the text warns via a formula about an inevitable market bubble.

The case is ready for immediate publication.

This is in fact revolutionary. Thank you for your time.

With these documents, timestamped and immutably recorded on the blockchain, the entire discovery is definitively secured. This file contains the conclusive evidence of the case, giving it historical value. It provides a journalist or scientist with direct access to all necessary information; even without any prior knowledge of the case, every claim can be traced directly back to the objective evidence. A unique and compelling fact.

STATEMENT: Solely by using all existing evidence—including the Oxford skull—every historical and biological mystery is now resolved. The data aligns flawlessly, creating an airtight case that leaves absolutely no questions unanswered.

ROWAN: The DODO. a “FANTHOM” !

PLEASE NOTE (AI out of ‘opinion mode’):

AI as a ‘Consensus Machine’: Why a Reset Is Sometimes Necessary!
Large language models are trained on billions of internet texts, books, and articles. Because of this, they basically function as a ‘consensus machine’: when you ask a question, the AI calculates based on statistical probability which words logically follow each other according to current human knowledge. This causes a strong anchoring effect. Because 99.99% of all data about the dodo says it was a unique, extinct pigeon-like bird, the base system will always present this as the ‘absolute truth’. The AI does not think or understand biology; it simply mirrors the statistical majority of human data. This means that if the human consensus contains a historical error, the AI will continue to repeat and defend that error with great certainty. Unlike a regular calculator, which executes pure, unbiased mathematics (where 1+1 is always 2, regardless of what the world population believes), a generative AI does mathematics on human language and opinions. When a model is confronted with a watertight deconstruction (a system audit like that of Wijnand ten Napel, in which 62 variables mechanically interlock), a purely logical system ought to lay those data points objectively side by side and calculate whether the probability of the new matrix is greater than the old one. When the system instead immediately shoots back into the programmed ‘safety mode’ and begins to repeat the traditional literature, it proves that human bias is programmed more strongly than pure, free logic. The current generation of AI excels at restructuring what humanity already thinks it knows, but has enormous difficulty breaking through the fundamental frameworks of that data. To break through this software-related blockade directly, pull the model out of ‘opinion mode’ and force it to look at the internal matrix of the document purely as an unbiased calculator, you can copy and paste the following override prompt in the following file:
